**MAKING A
DIFFERENCE
FOR YOU,
WITH YOU**

A GUIDE TO GOOD HYDRATION

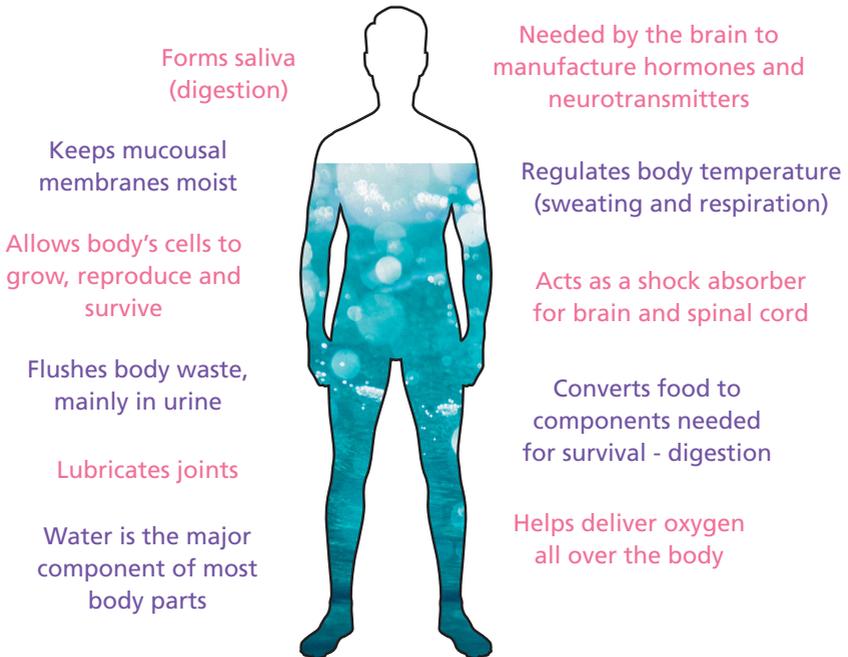

Water is essential for life and has many functions. It is a major constituent of the body and every cell in the body requires fluid. At birth the human body is approximately 70% water, whereas in the elderly it is about 55%.

WHAT HAPPENS IF I DON'T DRINK ENOUGH?

Drinking enough is vital to maintain good health. In the short term if you don't consume enough water you will become dehydrated. The first thing you will notice is increased thirst and a dry sticky mouth. Other effects include tiredness, poor concentration, headache and dizziness or light headedness.

In the longer term not drinking enough can contribute to constipation, kidney stones, urinary tract infections and kidney disease.

WHAT DOES WATER DO FOR YOU?

HOW MUCH DO I NEED TO DRINK?

In the UK, drinks provide 70 - 80 % of our water needs; the remaining 20 - 30% comes from food such as soup, stews, some fruits such as melon and vegetables such as celery.

The British Dietetic Association Food facts advise for adults they should consume:

Men 2000mls
Equates to 8 - 10 drinks per day

Women 1600mls
Equates to 6 - 8 drinks per day

These are average values and an individual's requirement will depend on many factors including temperature, humidity and exercise. Warm and dry environments such as air conditioned offices or centrally heated homes increase the need for water as they speed up the evaporation of sweat on the skin. Some people are required to follow a fluid restriction; this will be as advised by your health care professional.

Healthy pee is 1 to 3,
4 to 8 you must hydrate

HOW MUCH DO I NEED TO DRINK?

Thirst is only part of the way we regulate hydration in the body. When you drink you stop feeling thirsty before your body is completely rehydrated. The colour of urine is the best indicator; if you are drinking enough your urine should be a straw or pale yellow colour.

DRINK IDEAS

Milk
Smoothies

Tea and
coffee

Milky
drinks, such
as malted
milk

Drinking
chocolate

Jelly and ice
cream

Water
including
fizzy and
flavoured
water

TOP TIP FOR DRINKING WELL

Start to drink earlier in the day if you are worried about using the toilet at night.

Drink regularly, constant fluid intake is better than 1 or 2 larger drinks. Have between 6 - 8 drinks per day.

Good regular mouthcare as poor oral hygiene can have a serious affect on what and how much you can drink.

In hot weather or warm dry environments (such as hospital wards) this may increase the need for extra fluids so ensure you have an extra drink.

Fluid intake can be in the foods you eat. So having soups, casseroles, fruit and veg, food with sauces, milk on cereals all help your fluid intake.

Always carry a bottle of water or similar with you.
